

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

owner too soon. It is held that this "sufficient price" will be determined by the rate of increase of population in the place, the rate of wages there, the cost of living, and the soil and climate of the colony. It claims strangely that cheapness of land produces slavery, which really arises from the oppression of a conquered people by a superior conquering race.

The Puritans of New England were not, as Wakefield states, largely drawn from the nobility and gentry. They were mainly farmers and tradesmen. The reasoning of the work is a good example of the argumentation of the economic doctrinaire.

DAVID H. BUEL.

Are the Planets Inhabited? By E. Walter Maunder. Harper's Library of Living Thought. 166 pp. Index. Harper & Brothers, New York, 1913. 7 x 4½.

A concise handbook. Two points call for note. In one chapter the author discusses the problem of Mars and reaches conclusions which quite contravene the results of Percival Lowell's research. The greater point is that Professor Maunder establishes in terse statement the conditions under which life can exist upon any planetary body. Predicating the existence of a single sun at the center of any system there must be a nice adjustment of rotation and revolution periods of the satellite, of weight and mass, but the prime condition of the problem is the existence of water in a fluid state as the sole condition of life, that is water between its two critical points of freezing and of boiling. His conclusion is that the number of habitable worlds in the universe must be very small and that the possibility of life thereon is very slight indeed.
